FOREWORD

Government of Maldives is committed to continue to improve the health and well being of the people of Maldives through affordable and quality health services and by providing better access to health care. All inhabited islands of the country have a health care delivery centre managed and funded by the government. The provision of health care services in Maldives is through a 5 tier health care system. Severe limitation of local technical professionals and scarcity of financial resources are main challenges in meeting the needs of the community. The role of private sector is encouraged by the state, especially in the urban and semi urban islands. With expansion of services by the public as well as private sector the regulatory function of the health system needs to be strengthened.

Health Statistics in the form of an annual publication aims to provide factual information on our performance. Every effort is made to provide accurate data on the health services provided at both public and private health care facilities. The statistics support in formulating evidence-based health policies and monitor achievement of targets set in our National Plans and international commitments such as the Millennium Development Goals (MDGs). Furthermore, it is essential that high quality data are collected and regular data flow from different centres to the ministry is ensured for close monitoring of the current health status of the country so that appropriate measures can be taken to bring about necessary health reforms.

The Maldives Health Statistics 2012 is the sixth publication of this series. The information in the publication represents data from January to December 2011 with comparable figures for past 5 years.

For bringing out this publication, I sincerely acknowledge the hard work of Health Information Section staff, Ministry of Health and also thank all the staff who were involved in providing the statistics from the departments, divisions and health care facilities. I trust that policy makers, planners, researchers and students will make extensive use of this publication and our efforts in disseminating health information will be further strengthened.

Dr.Ahmed Jamsheed Mohamed
Minister of Health

ACKNOWLEDGEMENTS

The Maldives Health Statistics 2012 was prepared by the Health Information Section of the Ministry of Health. This publication was made possible through the valuable contribution from several concerned authorities and stakeholders; including the Health Care Institutions, divisions of Ministry of Health, Centre for Community Health and Disease Control (CCHDC) presently named as Health Protection Agency (HPA), National Social protection Agency (NSPA), Maldives Food and Drug Authority (MFDA), National Thalassaemia Centre presently named as Maldives Blood Services (MBS), Department of National Planning, Maldives Police Services and Maldives Customs Services. The demographic data provided by Department of National Planning was instrumental in computation of several of the indicators. I sincerely acknowledge the continued support and co-operation of these authorities in providing the necessary information.

Majority of the information contained in this publication is from the National Vital Statistics System (VSS) maintained by the Ministry of Health. The data for this system is obtained from the National Vital Registration System (VRS) maintained by Department of National Registration (DNR). I gratefully acknowledge the support provided by VRS staff at the Department of National Registration. Further, my appreciation goes to staff of Health Information Section, Ministry of Health for compiling the data, and making this publication possible.

Dr. Sheeza Ali

Director General of Health Services

EXECUTIVE SUMMARY

The Maldives Health Statistics is published with the main objective of providing easy access to up-to-date comprehensive statistical information on various aspects of health. The publication is divided into several subsections. This publication also includes updates and revisions of the data published in previous years.

During the last decade the population growth rate shows a trend towards stabilization. There was a slight increase in the Crude Birth Rate in the last few years, but has stabilized at 22 per 1000 population. However, an increase in birth rate is predicted in the years to come as the dominating young population reaches the reproductive age. And the trends show that in the last 10 years, Crude Death Rate has remained at 3 or 4 per 1000 population, mainly due to decline in infant and child mortality rates over the last two decades. Effective immunization programmes and access to better health care throughout the country has played a major role in the fall of death rates.

From observing the trends in the past 10 years it shows that the infant mortality rates (IMR) and child mortality rates have been slowly declining. Reduction in Child Mortality Rate is one of the goals of the Millennium Development Goals (MDGs) and utmost priority has been placed to reduce the Child Mortality Rate. The baseline data of 1990 indicates that Under-Five Mortality Rate stood at 48 per 1000 live births while IMR stood at 34 per 1000 live births. The MDG target for Maldives is to reduce Under Five Mortality to 16 per 1000 live births by the end of 2015. Thus, we are on track to achieve this target as the under five mortality rate has remained below 16 per 1000 live births in the last 5 years. We are now at a stage where work has to be done to sustain the achievements. Interventions that reduce neonatal mortality as well as those that deal with under-five malnutrition must be prioritized.

Maternal Mortality has been reduced significantly over the years. Maternal Mortality Ratio (MMR) was 56 per 100,000 live births in 2011. The baseline for MMR in 1990 was 500 per 100,000 live births. Even though, there are slight fluctuations in the MMR in recent years, the MDG target of reducing MMR by half by 2015 has been achieved. However, it has to be noted that the MMR figures can change considerably in a country like Maldives with such a small population. Even a single maternal death can have a large effect on the MMR.

Looking at the cause of death data it can be observed that there is a high number of ill-defined causes. This means the causes certifiers are putting on the death certificates do not provide enough information to properly establish the cause of death. Since the cause of death data is important in health planning and establishing priority programs, it is imperative that good quality causes of death data are produced. For this purpose we need to improve death certification and provide appropriate training to medical professionals and coders. This will enable us to strengthen establishing a clear cause of death from the maintained documentation.

In 2010, the leading cause of death for the country was hypertensive diseases, which was 18% of the total deaths. And in 2011, the top cause of death was heart diseases.

Vector borne diseases such as Dengue and Chikungunya continue to be reported throughout the year, with Dengue fever most prevalent during June to August. In 2011 there was a Dengue outbreak which reported a total of 2909 dengue cases and also reported the highest number of deaths to date that was reported in a year. During the dengue peak in July 2011 a total of 595 Dengue fever cases and 97 Dengue Hemorrhagic fever cases were reported. Measures need to be taken to eliminate mosquito breeding grounds and take special precautions, especially during the peak seasons of disease, to reduce the number of Dengue cases.

It has to be noted that data collection mechanisms for non-communicable diseases (NCDs) need to be strengthened as the country is in transition from communicable diseases to a higher burden of NCDs.

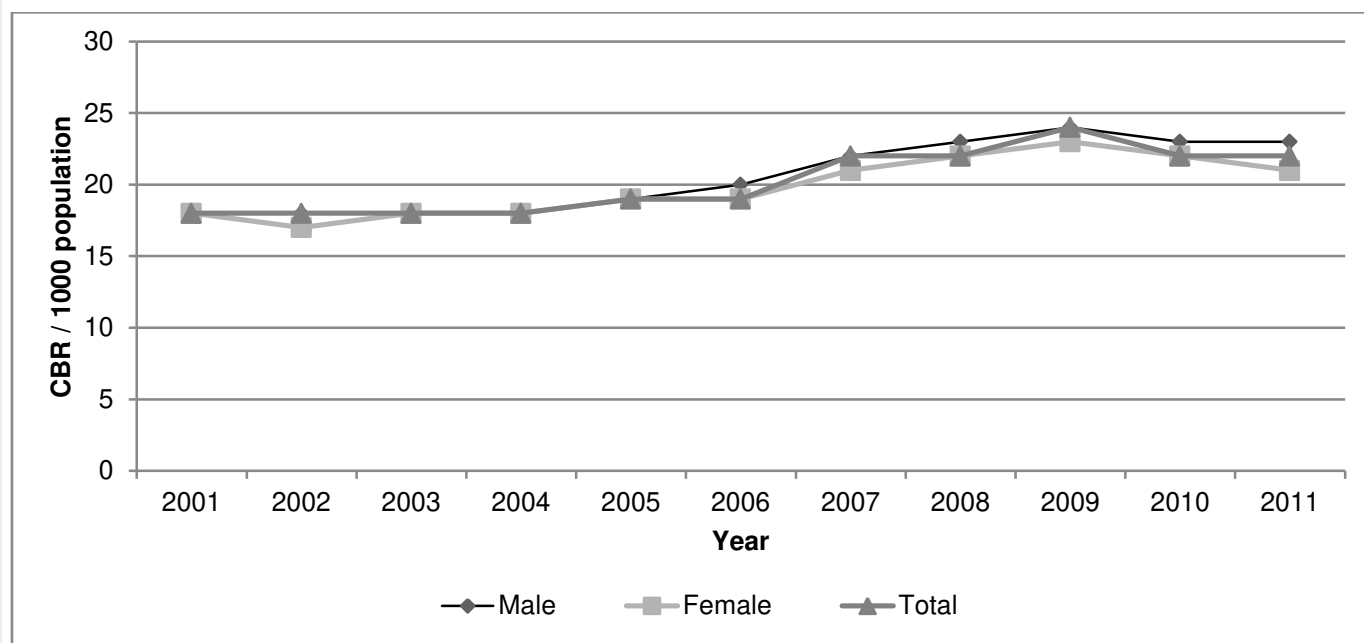

Routinely collected Human Resource and health expenditure data has some limitations due to lack of appropriate data collection systems in place. And with the recent health care reforms in service provision especially the newly formed health service corporations challenged the collection of accurate data on human resources as it is not properly maintained and or collected.

Looking at other data, childhood immunization is an area we are currently achieving good results and the MDG target for immunization of children under 1 for measles was achieved in 2009. Overall, it can be said that the trends show improvement in the health and well being of people of Maldives as evident from the health indicators such as Crude Death Rate, Infant Mortality Rate, Under-five Mortality Rate and Maternal Mortality Ratio. Consistent improvements in quality of services are crucial to sustain these developments and further the achievements. Improvements in data collection, collation and analysis are the gateways for proper monitoring of effectiveness and for the application of evidence based decisions when formulating health policies.

Republic data includes births occurred abroad (2011 abroad births (Not stated =38, Male=26, Female=12))

Note1: some of the figures have been revised as previously unavailable data is available.

Note 2: All year's total includes births occurred abroad as well, therefore Atolls total plus Male' total will not be same as Republic total.

Note: Under five mortality can be affected by slightly lower number of Live births compared to number of live births in 2009. The lower number may be due to the fact that we have not received all the births occurred abroad.

TABLE 17: MATERNAL MORTALITY RATIO PER 100,000 LIVE BIRTHS, 2001 - 2011
